

1. Project Overview

Goal: To analyze global workflow efficiency and identify staffing bottlenecks across 4 regions (AMER, EMEA, APAC, LATAM).

Data Source: Synthetic Workforce Management (WFM) dataset containing 24-hour logs of handled volumes, agent activity, and wait times.

2. KPI Definitions (The Knowledge Base)

Service Level (SL): The percentage of tasks handled within the defined goal time. A high SL (e.g., 92.6%) indicates a healthy balance between workload and staffing.

Operations Index: A weighted health score that combines Service Level, Wait Time, and Abandonment rates into a single "Executive Grade."

Staff Productivity: Calculated as $\{\text{Total Handled Volume}\} / \text{div } \{\text{Total Active Agents}\}$. This identifies which Business Units are working most efficiently.

3. Technical Tools Used

Pivot Tables: Used to aggregate thousands of rows of raw data into summarized views for Business Units and Regions.

Calculated Fields: Implemented custom mathematical logic within the Pivot Tables to ensure productivity ratios update accurately when filtered.

Slicers: Added interactive "Global Filters" to allow users to drill down into specific Regions or Channels instantly.

OPERATION INDEX

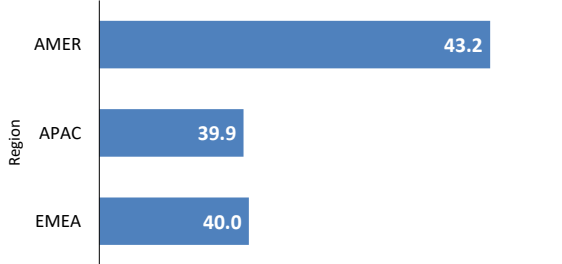

Average Service Level
92.6%

Average Wait Time
43.2 sec
(Red Warning)

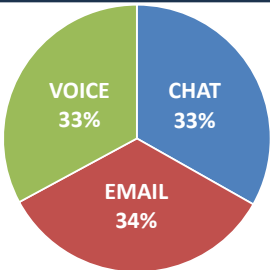

Average Service Wait Time
29.1 sec

Abandon Rate
7.60%
(Orange Warning)

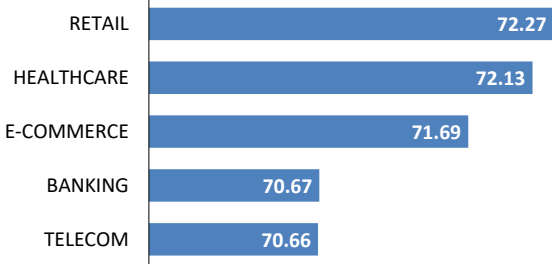

1.REGIONAL LATENCY (Avg Wait Time,Second)

2.TOTAL WORKLOAD DISTRIBUTION

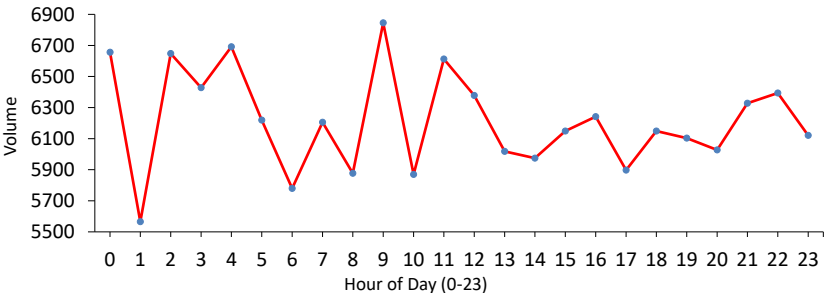

3. STAFF PRODUCTIVITY BY BUSINESS UNIT(Tasks Per Agent)

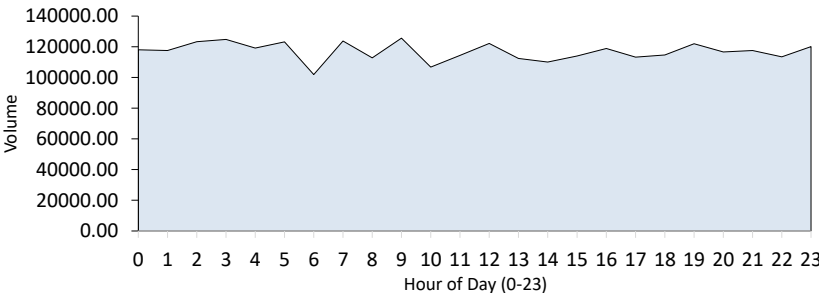

4.VOLATILITY TRENDS: WORKLOAD VS LEAKAGE

B. Service Leakage (Abandoned Volume)

A. Total Workload (Offered Volume)

EXECUTIVE STRATEGIC REPORT: GLOBAL OPERATIONS

1. OVERVIEW

This report provides a strategic evaluation of global workflow performance. While the current **Service Level (SL) of 92.6%** exceeds the corporate target of 90%, deep-dive analysis reveals specific regional latencies and hourly volatility that require management intervention to maintain long-term stability."

2. DATA INSIGHTS

- 1. Peak Volume Alert:** A significant "Service Leakage" (Abandonment) spike occurs daily at **09:00 (Hour 9)**, resulting in an average of 6,845 lost tasks per month.
- 2. Regional Latency:** The **AMER region** is currently a bottleneck with an Average Wait Time (AWT) of **43.2s**, significantly higher than APAC (29.1s) and EMEA (35.2s).
- 3. Productivity Winner:** The **Retail** unit is the efficiency leader at **72.3 tasks per agent**, outperforming the "Segment" unit by over 100%.

3. ROOT CAUSE ANALYSIS

The Hour 9 performance drop correlates with morning shift handovers. The lack of staff overlap during this transition period leads to a queue buildup that the AMER region struggles to clear, causing the 43.2s latency observed in the data.

4. STRATEGIC RECOMMENDATIONS

- 1. Implement 'Bridge Shifts':** Introduce a 2-hour overlap shift (08:30 – 10:30) to absorb the Hour 9 volume surge.
- 2. Cross-Regional Support:** Reallocate 15% of APAC agent bandwidth to support AMER queues during their morning peak to balance global Wait Times.
- 3. Best Practice Transfer:** Conduct a workflow audit of the **Retail** unit to standardize their high-productivity methods (72.3 tasks/agent) across other business units.
